

1. created a virtual machine in VBox say VM1
2. installed Linux OS into the machine VM1
3. Installed Anaconda Distribution of Python

save the machine for future Use

- EXPORT

it will save one Image of the above created machine with all its environment.

When we want to use the saved virtual machine again, we need to IMPORT the image in VBox

what is VBox??

- its a open source software from Oracle organization which allows us to create/ import previously created virtual machine.

- what is cloudera ??

its an MNC which mainly provide software solution for cloud

- what is cloudera quickstart VM??

I am not giving a direct ans...but giving a clue

-- 1. created a virtual machine in VBox say "quick startVM"

2. install Linux OS into the machine "quick startVM"

3. Installed basic hadoop environment on "quick startVM"

save the machine for future Use

- use EXPORT option in VBox

it will save one Image of the above created machine with all its environment.
